

We rely pretty heavily on AI assisted coding in our process so we've changed our assessments from "Please create a function to do X" to more of a code review. The idea is that we will provide you with some AI generated code and we would appreciate your assessment of it, identify issues with the AI output, and let us know if you feel that it could be moved forward and pushed to QA or needs rework to fix issues.

For context on this we run an event-sourced identity platform: every change to an account — logins, failed logins, password changes, and so on — is written as an immutable event onto a per-account log, and we rebuild current state by replaying those events in order. A few things follow from that, and they're the things to keep in mind while you read:

- Order is only guaranteed *within* one space, our partition is connect/space (accounts, people, permissions, etc)
- The log is append-only. Once an event is written it's never edited or deleted — it's the source of truth for audit and forensics, and anything you put in it lives there forever.
- Delivery to consumers is at-least-once, so duplicates and retries happen.
- We're at the scale of a few hundred thousand accounts, each with a long history.

Based off that I asked Claude Code to write two things, one in Go and one in Python. An ingest consumer that applies events to the current state projection and a risk scorer that trains a classifier off of an account's event history. The main questions we have for you are

- 1 – Would you merge these as is, and if not why not
- 2 – What issues are there, ideally ranked by the most critical so a PM could make a stop-ship or accept decision on them
- 3 – What additional tests would need to be written/run before you would feel comfortable shipping these
- 4 – What you think the model did well. We maintain ongoing skills for our coding assistants and always try to identify good patterns it creates to add to those

We're not looking for a specific number of issues. Just what you think is most critical/important to pass up.

Thanks so much and I look forward to seeing what you come up with.
